This course includes both theoretical and practical knowledge. The course provides an overview of the general principles of optimizing the allocation and use of resources, including generation, energy, and raw materials. Applications of optimization in the power systems sector range from analyzing transmission grids and power flows to active power and reactive power compensation. We focus on key mathematical and algorithmic elements, methods, and tools in the courses. An emphasis is placed on understanding applied examples. The course includes both theoretical and practical knowledge. The theoretical part of the course introduces basic terms and gives a formal overview of optimization principles and methods. The practical part covers optimization problems in the electric power systems sector and uses MATLAB for solving various optimization problems. The courses are modular and, thus, can be taken as stand-alone subjects. The University of Chicago provides public access to some of its data through OpenAthens.
